

A. Temporal Shear vs Broadband Delay

B. Distribution of Temporal Shear

C. Detection Significance Distribution

D. Summary

COSMOGRAIL Temporal Shear Analysis

Systems analyzed: 18
Image pairs: 48

Significant detections:

- >3 sigma: 0 pairs
- >2 sigma: 0 pairs

Strongest finite measurements:

- DESJ0408 B-D: $\Gamma = 40.7 \pm 25.6$ (1.59 sigma)
- PG1115 A-C: $\Gamma = 29.0 \pm 18.8$ (1.54 sigma)
- DESJ0408 A-B: $\Gamma = -90.7 \pm 72.0$ (1.26 sigma)

Interpretation:

Under GR, $\Gamma = 0$ (constant delay).
Under TEP-GL, $\Gamma \neq 0$ (scale-dependent).

Status: NULL: No significant temporal shear detected. Consistent with GR (single constant delay).
